ACES Graphcore Intelligence Processing Units (IPUs) Tutorial

07/14/2023

ACES Workshop

Chad Martin (Graphcore)
Zhenhua He (Texas A&M HPRC)

High Performance Research Computing

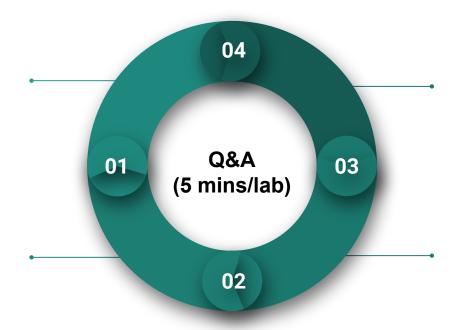

IPU Tutorial

Section I. Intro to IPUs (30 mins)

We will introduce Graphcore IPU architecture, and the IPU systems on TAMU ACES platform.

Section II. Demo on ACES (30 mins)

We will demonstrate how to run models of different frameworks on ACES IPU system.

Structure of the IPU Tutorial.

Section IV. Porting PyTorch code to IPU (30 minutes)

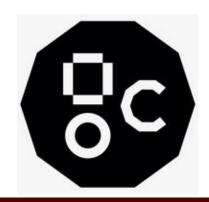

We will learn to port a PyTorch Fashion-MNIST classification model to run on IPU

Section III Porting TensorFlow code to IPU (30 minutes)

We will learn to port a Keras MNIST classification model to run on IPU

Section I. ACES and IPU Systems Overview

ACES

Mission:

- Offer an accelerator testbed for numerical simulations and AI/ML
- Provide consulting, technical guidance, and training to researchers
- Collaborate on computational and data-enabled research.

Credit: towardsdatascience.com

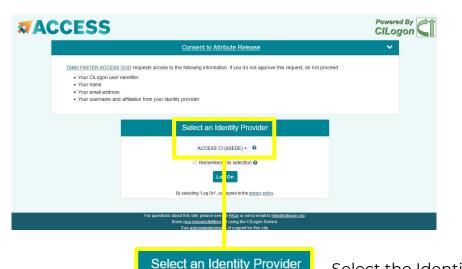

Log into ACES Using the HPRC Portal

HPRC webpage: https://hprc.tamu.edu/, Portal dropdown menu

Accessing ACES via the ACES Portal (ACCESS)

ACCESS CI (XSEDE) . 0

Log-in using your ACCESS credentials.

Training Materials

• From the ACES login node, ssh into the poplar2 (BOW Pod16) IPU system

```
ssh poplar2
```

• Change to your scratch directory:

```
cd $SCRATCH
```

Copy the example materials to your scratch directory:

```
git clone https://github.com/graphcore/examples.git
```

Copy the hands-on exercise materials to your scratch directory:

```
git clone https://github.com/happidence1/IPU-Training.git
```

Poplar SDK setup

```
source
/opt/gc/poplar/poplar sdk-ubuntu 20 04-3.3.0+1403-208993bbb
7/poplar-ubuntu 20 04-3.3.0+7857-b67b751185/enable.sh
source
/opt/gc/poplar/poplar sdk-ubuntu 20 04-3.3.0+1403-208993bbb
7/popart-ubuntu 20 04-3.3.0+7857-b67b751185/enable.sh
mkdir -p $SCRATCH/tmp
export TF POPLAR FLAGS=--executable cache path=$SCRATCH/tmp
export POPTORCH CACHE DIR=$SCRATCH/tmp
```

Run a TensorFlow (TF) model on IPU

TF Virtual Environment Setup

```
virtualenv -p python3 venv tf2
source venv tf2/bin/activate
python -m pip install -U pip
python -m pip install
/opt/gc/poplar/poplar sdk-ubuntu 20 04-3.3.0+1403-208993bbb
7/tensorflow-2.6.3+gc3.3.0+251582+08d96978c7f+intel skylake
512-cp38-cp38-linux x86 64.whl
```

Run a TensorFlow model on IPU

cd examples/tutorials/tutorials/tensorflow2/keras/completed_demos/
python completed_demo_ipu.py

Deactivate the virtual environment after the model finishes running.

deactivate

Monitor the IPU usage with gc-monitor command

watch -n 2

Hands-On Session 1

- Please access ACES and poplar2 now.
- Copy the tutorial materials to your scratch directory.
- Run the TensorFlow and PyTorch (PopTorch) example models on IPU

Section III. Porting TensorFlow Code to IPU

1. Import the TensorFlow IPU module

Add the following import statement to the beginning of your script:

from tensorflow.python import ipu

2. Preparing the dataset

Make sure the sizes of the datasets are divisible by the batch size

```
def make_divisible(number, divisor):
    return number - number % divisor
```

Adjust dataset lengths

```
(x_train, y_train), (x_test, y_test) = load_data()
train_data_len = x_train.shape[0]
train_data_len = make_divisible(train_data_len, batch_size)
x_train, y_train = x_train[:train_data_len], y_train[:train_data_len]
test_data_len = x_test.shape[0]
test_data_len = make_divisible(test_data_len, batch_size)
x test, y test = x test[:test data_len], y test[:test data_len]
```

3. Add IPU configuration

To use the IPU, you must create an IPU session configuration:

```
ipu_config = ipu.config.IPUConfig()
ipu_config.auto_select_ipus = 1
ipu_config.configure_ipu_system()
```

A full list of configuration options is available in the API documentation.

4. Specify IPU strategy

```
strategy = ipu.ipu_strategy.IPUStrategy()
```

The tf.distribute.Strategy is an API to distribute training and inference across multiple devices. IPUStrategy is a subclass which targets a system with one or more IPUs attached.

5. Wrap the model within the IPU strategy scope

- Creating variables and Keras models within the scope of the IPUStrategy object will ensure that they are placed on the IPU.
- To do this, we create a strategy.scope() context manager and move all the model code inside it.

Hands-on Session 2

Activate the TF virtual environment
 cd \$SCRATCH
 source venv_tf2/bin/activate

- Change directory to Keras
 cd IPU-Training/Keras
- Complete the #Todos in the mnist-ipu-todo.py file.
- Run it in the venv_tf2 virtual environment.
 python mnist-ipu-todo.py
- After finishing the job, you can deactivate the virtual environment
 deactivate

Section IV. Porting PyTorch Code to IPU

PopTorch

• PopTorch is a set of extensions for PyTorch released by Graphcore to enable PyTorch models to run on Graphcore's IPU hardware.

 PopTorch will use PopART to parallelise the model over the given number of IPUs. Additional parallelism can be expressed via a replication factor, which enables you to data-parallelise the model over more IPUs.

Training a model on IPU

Import the packages

```
import torch
import poptorch
import torchvision
import torch.nn as nn
import matplotlib.pyplot as plt
from tqdm import tqdm
from sklearn.metrics import accuracy_score
```

Load the data

PopTorch offers an extension of torch.utils.data.DataLoader class with its poptorch.DataLoader class, specialized for the way the underlying PopART framework handles batching of data.

Build the model

```
class ClassificationModel(nn.Module):
                                                   def forward(self, x, labels=None):
    def init (self):
                                                           x = self.pool(self.relu(self.conv1(x)))
        super(). init ()
                                                           x = self.norm(self.relu(self.conv2(x)))
        self.conv1 = nn.Conv2d(1, 5, 3)
                                                           x = \text{torch.flatten}(x, \text{ start dim=1})
        self.pool = nn.MaxPool2d(2, 2)
                                                           x = self.relu(self.fcl(x))
        self.conv2 = nn.Conv2d(5, 12, 5)
                                                           x = self.log softmax(self.fc2(x))
        self.norm = nn.GroupNorm(3, 12)
                                                           # The model is responsible for the
        self.fc1 = nn.Linear(972, 100)
                                                   calculation of the loss when using an IPU. We do
        self.relu = nn.ReLU()
                                                   it this way:
        self.fc2 = nn.Linear(100, 10)
                                                           if self.training:
        self.log softmax = nn.LogSoftmax(dim=1)
                                                               return x, self.loss(x, labels)
        self.loss = nn.NLLLoss()
                                                           return x
                                                   model = ClassificationModel()
```

model.train()

Prepare training for IPUs

The compilation and execution on the IPU can be controlled using poptorch.Options. These options are used by PopTorch's wrappers such as poptorch.DataLoader and poptorch.trainingModel.

opts = poptorch.Options()
train_dataloader = poptorch.DataLoader(
 opts, train dataset, batch size=16, shuffle=True, num workers=20

Train the model

```
optimizer = poptorch.optim.SGD(model.parameters(), lr=0.001, momentum=0.9)
poptorch model = poptorch.trainingModel(model, options=opts,
optimizer=optimizer)
epochs = 30
for epoch in tqdm(range(epochs), desc="epochs"):
    total loss = 0.0
    for data, labels in tqdm(train dataloader, desc="batches", leave=False):
        output, loss = poptorch model(data, labels)
        total loss += loss
poptorch model.detachFromDevice()
torch.save(model.state dict(), "classifier.pth")
```

Evaluate the model

```
model = model.eval()
poptorch model inf = poptorch.inferenceModel(model, options=opts)
test dataloader = poptorch.DataLoader(opts, test dataset,
batch size=32, num workers=10)
predictions, labels = [], []
for data, label in test dataloader:
    predictions += poptorch model inf(data).data.max(dim=1).indices
    labels += label
poptorch model inf.detachFromDevice()
print(f"Eval accuracy: {100 * accuracy score(labels,
predictions):.2f}%")
```

Hands-on Session 3

Activate the TF virtual environment
 cd \$SCRATCH
 source poptorch_test/bin/activate

- Change directory to PyTorch
 cd IPU-Training/PyTorch
- Complete the #Todos in the fashion-mnist-pytorch-ipu-todo.py file.
- Run it in the poptorch_test virtual environment.
 pip install scikit-learn
 python fashion-mnist-pytorch-ipu-todo.py
- After finishing the job, you can deactivate the virtual environment deactivate
